

Adminer Login "Session expired, please login again"

<https://orbisius.com/blog/adminer-login-session-expired-please-login-again/>

Did you have the same problem?

Well, do make sure that adminer can access the session folder or if there's a restriction such as `openbase_dir.(php open_basedir)`.

To check you may need to create a temporary file called `000info.php` with the following contents.

You can use your favorite FTP program or the File Manager within your control panel to create and update it.

Then point your browser to `your-site.com/000info.php`

```
<?php phpinfo();
```

Checking `session.save_path` php setting

We're using `000info.php` because many people will try to access `info.php` or `phpinfo.php` and see your php settings. The less people know about your site and configuration the better. **After you're done delete the file.**

`session.save_path` usually points to `/var/lib/php/sessions`, however it may have been modified.

Checking `session.open_basedir` php setting

This may be empty or contain multiple folders. With this setting php can't open files outside of the whitelisted folders.

What is adminer?

Adminer is a full-featured database management tool written in PHP. It consist of a single file ready to deploy to the target server. Adminer is available for MySQL,

MariaDB, PostgreSQL, SQLite, MS SQL, Oracle, Elasticsearch, MongoDB and others via plugin
