

How to Find What WooCommerce Version you're Using

<https://orbisius.com/blog/find-woocommerce-version/>

The WooCommerce plugin defines **WC_VERSION** php constant to tell which version it's currently at.

If you want to check and do some actions if the version of the plugin is greater than X then you can do this.

First check if the constant is defined and then use the php function `version_compare()` to compare the version.

```
if (defined( 'WC_VERSION' ) && version_compare( WC_VERSION, '7.0' ) '>=' )) {  
    // do something if WooCommerce version is greater than 7.0  
}
```

If the `WC_VERSION` constant is not defined that means that WooCommerce plugin is not installed, activated or your code is checking too early when not all plugins were loaded by WordPress just yet.

Can you set up a test/staging WordPress sites in seconds? Yes, with [qSandbox](#) you can.
