

How to Redirect using RedirectMatch in Apache .htaccess

<https://orbisius.com/blog/how-to-redirect-using-redirectmatch-in-apache-htaccess/>

We've been making some progress on the [WPGigs.net](#) project. It's about WordPress jobs.

For some reason the RankMath plugin decides to expose the root custom post type in a sitemap. To avoid duplicate content we redirect /project => /projects. We use RedirectMatch because we want to use a bit of regular expressions to tell that only /project needs to be redirected and not /project/some-project-info-p123 -> /projects

```
RedirectMatch 301 "/?project/?$" "/projects"
```
